

BIKI LISASTE PASME

Za osemenjevanje plemenic **lisaste pasme** je v katalog uvrščenih osem-najst testiranih bikov, osem s poudarkom na mleku, osem s poudarkom na mleku in mesu in dva bika s poudarkom na mesu. Bika s poudarkom na mesu priporočamo za reje krav dojilj in kombinirane reje.

Odbranih je tudi dvaindvajset **mladih bikov**. Po programu osemenje-vanja za lisasto pasmo se do porabe semena mladih bikov z mladi-mi biki obvezno osemenjuje vse krave lisaste pasme v spomladan-skem in jesenskem obdobju. V času osemenjevanja z mladimi biki ni dovoljeno osemenjevanje s testiranimi biki. S testiranimi biki se v tem času lahko osemenjujejo le bikovske matere.

Med odbranimi biki so trije biki s 25 in več odstotki tuje pasme. To so biki ROVKO (50 % RH), BREMEN (25 % MB) in BONET (25 % MB). Ti biki se uporabljajo za oplemenjevanje lisaste pasme s pasmo rdeči hol-štajn (RH) ali s pasmo montbeliard (MB). S temi biki se lahko oseme-njuje vse leto, vendar le na rejčeve željo oz. zahtevo. Za te bike se bo-do odločali rejci, ki želijo izrazito povečati mlečnost. Seme teh bikov naj se ne uporablja v rejah krav dojilj. Pri tem ne smemo spregledati, da se pri potomcih teh parjenj zmanjšuje odstotek genov lisaste pasme. Z nadaljevanjem tega procesa dobimo živali, pri katerih prevladujejo geni druge pasme. Na primer potomci bika Rovka in krav lisaste pasme (100 % LS) bodo imeli še 25 % RH pasme in tako ne bodo mogli biti vpisani v glavni del rodovniške knjige, saj presegajo dovoljeni odstotek druge pasme (do 13 %) za čistopasemske plemenske živali.

Ker je poreklo plemenskih živali pri vpisu v rodovniško knjigo zelo pomembno, moramo na poreklo potomcev misliti že ob izbiri bika za ose-menjevanje. To velja še posebej za lisasto pasmo, kjer je bilo zadnja le-ta precej prisotno oplemenjevanje s pasmo rdeči holštajn in montbeliard.

Odsvetujemo osemenjevanje krav, ki že imajo določen odstotek pasme RH s semenom bikov, ki imajo tudi gene pasme MB in nasprotno.

PREGLED TESTIRANIH BIKOV LISASTE PASME

Testirani biki lisaste pasme s standardiziranimi plemenskimi vrednostmi (PV12) za nekatere najpomembnejše lastnosti iz sklopor. lastnosti mlečnosti, telesne lastnosti, pitovne in klavne lastnosti in skupna selekcijska indeksa (SSI). Glede na želeno vrednost PV12 za lastrost je v oklepaju podan tudi rang (mesto), ki ga bik dosega med testiranimi biki lisaste pasme, odbranimi za leto 2006.

MLADI BIKI LISASTE PASME

Pri nekaterih mladih bikih je velika nevarnost parjenja v sorodu. Rejce in izvajalce osemenjevanja opozarjamo, da preverite poreklo posamezne krave ali telice in se šele potem odločite za uporabo semena določenega bika.
